ABSTRACT

On the Gnome event, Edgerton, Germeshausen and Grier, Inc., performed the technical photography of surface motion, Project 1.3, for the Defense Atomic Support Agency. The project entailed photographic recording of earth motion in and around the Surface Zero area, processing of the resultant film records, production of requested prints, analysis of the photographic records, and submission of the resultant data.

The earth motion was recorded photographically from a distance by cameras equipped with long-focal length lenses and "close-in" by use of special "inertia-weight" instrumentation. In the long-range photography, the displacement of target arrays anchored in and around Surface Zero was photographed by cameras which were placed far enough distant to have finished recording the maximum earth motion before arrival of the shock wave. With the "inertia-weight" instrumentation, close-in, shock-mounted cameras recorded the displacement of marked targets in relation to a spring-suspended "inertia-weight" which remained essentially motionless during the time of interest.

All but one of the fifteen cameras used to document the earth motion operated well on the Gnome event and good records were obtained. Measured maximum displacements were as follows:

69.6 + in.	at 15.24 meters	*
72.7 + in.	at 32.32 meters	*
19.65 in.	at 137.20 meters	
7.58 in.	at 274.31 meters	

*Maximum earth motion is greater than measured; observed records are as yet incomplete.

TECHNICAL PHOTOGRAPHY OF SURFACE MOTION

INTRODUCTION

Project Gnome involved detonation of a nominal 5-kt nuclear device 366 meters underground at the end of a 340-meter long, hooked and self-sealing tunnel in the Salado formation in the Delaware Basin, Eddy County, New Mexico. The shot occurred on 10 December 1961. On this event, Edgerton, Germeshausen & Grier, Inc. (EG&G) performed surface motion photography, Project 1.3, under the sponsorship of the Defense Atomic Support Agency (DASA). Using a single long-range and three short-range photo stations, EG&G recorded earth motion in the Surface Zero area.

The EG&G program for Project 1.3 involved four objectives:

(1) photographic recording of the earth motion (displacement) and the subsequent calculation of the velocity and acceleration of the motion in and around the Surface Zero area; (2) processing of the motion picture records; (3) production of sufficient prints to satisfy DASA and AEC requirements; and, (4) analysis of the photographic records and submission of the resultant data.

Background. EG&G has previously performed surface-motion photography for the Lawrence Radiation Laboratory on AEC test series detonations, for the AEC on Program Plowshare, and for DASA on the Nougat series. This work is documented in detail in the following reports:

- (1) "Photographic Analysis of Earth Motion - Shot Rainier," EG&G Staff, Project 26.4, WT-1532, July 1958.
- (2) "Operation Hardtack, Earth Motion Studies," EG&G Staff, ITR-1706, May 1959.
- (3) "Final Report - Photographic Earth Motion Study, Scooter Event," S. Feigenbaum and P. Wagkamp, EG&G Report No. L-510, 15 February 1961.

- (4) "Project Rowboat - Final Report," L. Donovan, EG&G Report No. L-547, 1 August 1961, and
- (5) "Preliminary Report, Antler Event, Project 1.3, Surface Motion Photography," B. Carder, D. Barnes, and L. Donovan, Report VUP-2200, 31 October 1961.

In addition to surface motion studies which involve photographing an array of fixed targets in the Surface Zero area with distant cameras equipped with long-focal-length lenses, EG&G has pioneered in the design and assembly of portable "inertia-weight" photo stations for close-in measurement of surface motion. The design and application of these close-in "inertia-weight" stations is set forth in the following proposals submitted to DASA:

- (1) "Technical Proposal - Surface Motion Photography for Project Orchid," EG&G Report No. B-2150, 19 October 1960.
- (2) "Technical Proposal - Surface Motion Photography for Project Hard Hat," EG&G Report No. B-2260, 30 June 1961, and
- (3) "Technical Proposal - Surface Motion Measurement for Project Gnome," EG&G Report No. B-2278, 16 August 1961.

Theory. Good surface-motion measurements can be made by long-range photography and close-in photography. The two methods, which are complementary, provide good resolution measurement of ground excursions ranging from a few inches to several feet and occurring over a time interval of several minutes.

In the long-range photography, cameras equipped with long-focal-length lenses are positioned at a distance to record the displacement of an array of fixed targets positioned radially about Surface Zero.

Frame rates and lenses for the battery of cameras are selected to

cover a wide range of actions and the camera station is placed at a distance which will allow recording of the maximum surface motion before arrival of the shock wave. In general, cameras with long focal-length lenses and rapid frame rates are used for precise recording of earth motion. Shorter focal-length lenses and slower frame rates are employed on cameras used for documenting gross motion.

In the close-in photography, surface-motion measurements are made with an "inertia-weight" target and close-in photo station which represent a new concept in surface-motion photography. With this method, a shock-mounted photo station is positioned close-in to record the displacement of an "inertia-weight" in reference to a graduated target which is rigidly anchored in the Surface Zero area. The inertia-weight (a specific weight suspended on the end of a helical spring) is designed to remain essentially motionless through the time of interest (approximately 1.6 sec) and it serves as a fixed reference for any target motion induced by the surface motion. Close-in shock-mounted photo stations record the target displacement in relation to the fixed inertia-weight position and provide high-resolution measurements of surface motion.

INSTRUMENTATION

Long-Range Camera Station. The long-range camera station (Fig. 1) was housed in a transportainer and mounted on a concrete pad 1,274.86 meters from Surface Zero (SZ) on a bearing of S 28° 23' 11" E. The entire station was elevated to provide an unobstructed view of the target array. A gasoline-powered generator located next to the transportainer was used for battery charging and for power for the radio link to the EG&G net.

Station instrumentation included six cameras mounted on two drill-press stands, batteries for operating power, control equipment, and a radio tone receiver. The station camera complement and pertinent operating details are given in the following table. Full documentation of

Fig. 1. Long-range camera station.

camera types, markers, running times, films, and exposures is given in the Photo Plans and Photo Loading Charts in Appendix A of this report. The location and elevation of all camera stations and targets are also given in Appendix A.

TABLE 1. LONG-RANGE CAMERA DETAILS

Camera Type	Nominal Focal Length Lens (mm)	Nominal Frame Speed (frames/sec)	Timing Marks (cps)	Operating Time
35-mm Mitchell	305	50	100	-5 sec to +2 min
35-mm Mitchell	152	50	100	-5 sec to +2 min
35-mm Mitchell	75	50	100	-5 sec to +2 min
35-mm Mitchell	35	50	100	-5 sec to +2 min
35-mm Mitchell	305	35	25	-5 sec to +3 min
70-mm Maurer	150	2-1/2	None	-5 sec to +1-1/2 min

Long-Range Target Array. The long-range target array consisted of fifteen individual targets positioned radially from Surface Zero (Fig. 2). Seven targets were placed at distances of 15.24, 30.39, 60.98, 91.46, 137.20, 182.93 and 274.39 meters on a bearing of S20° 00' E. Seven other targets were similarly spaced on a bearing of N70° 00' E. The fifteenth target was placed approximately one meter away from Surface Zero and in-line with the seven targets on both bearings. The 15.24 and 30.49 meter targets on the N70° 00' E bearing were equipped with flash bulbs to facilitate recognition of the SZ target in subsequent analysis.

The individual targets (Fig. 3) were 3-ft square wooden frames covered with white nylon parachute material. The targets were bolted approximately 8 ft above ground level to iron posts which were imbedded in concrete blocks buried in the ground. A 1-ft aluminum cross (painted black) was attached to each target at a distance of 3-1/2 in. from the

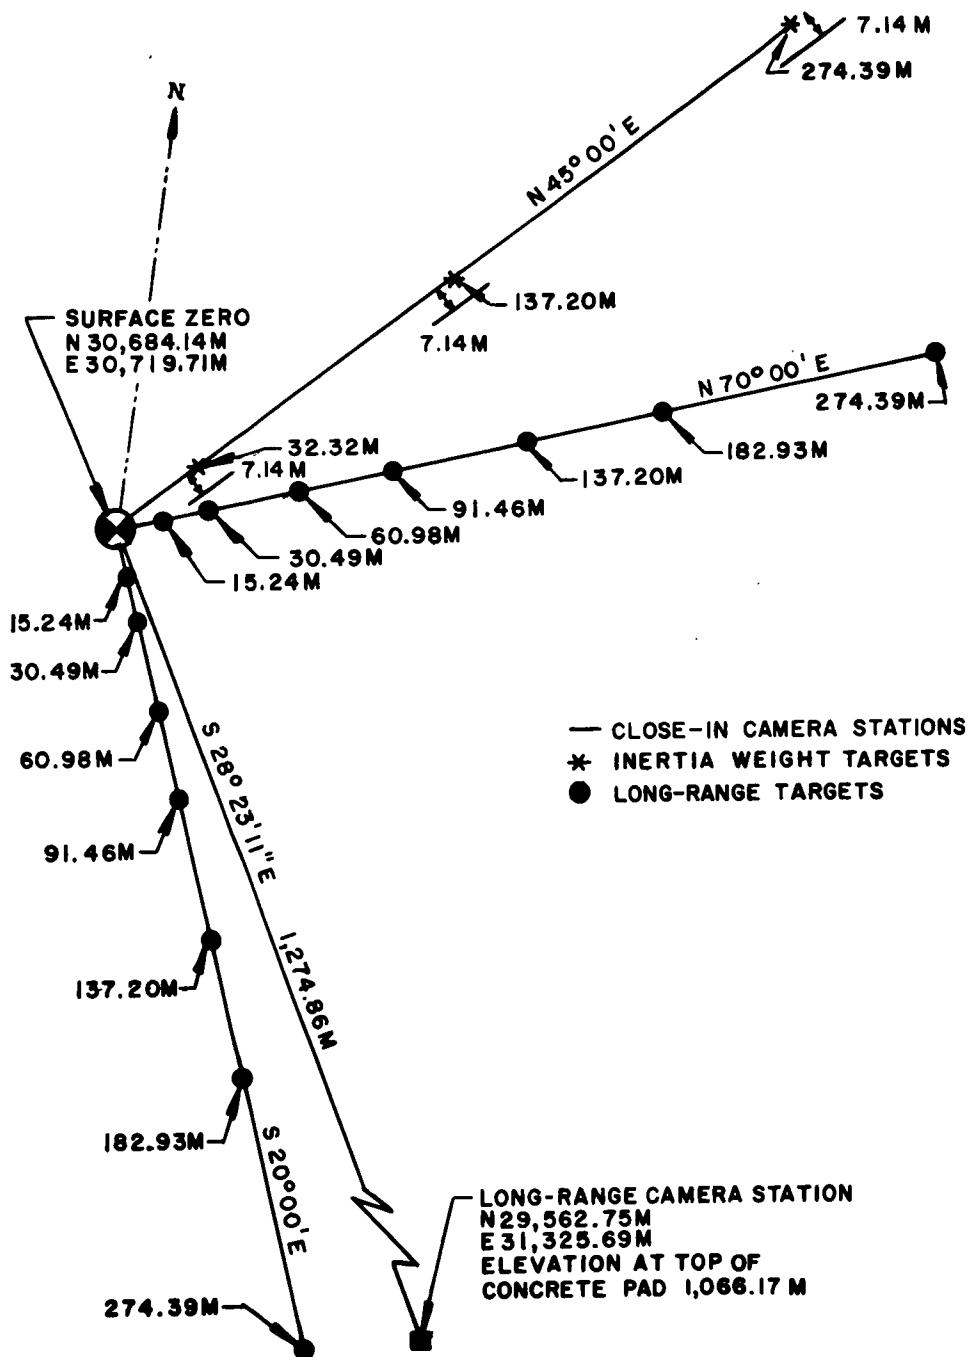

Fig. 2. Long-range target array.

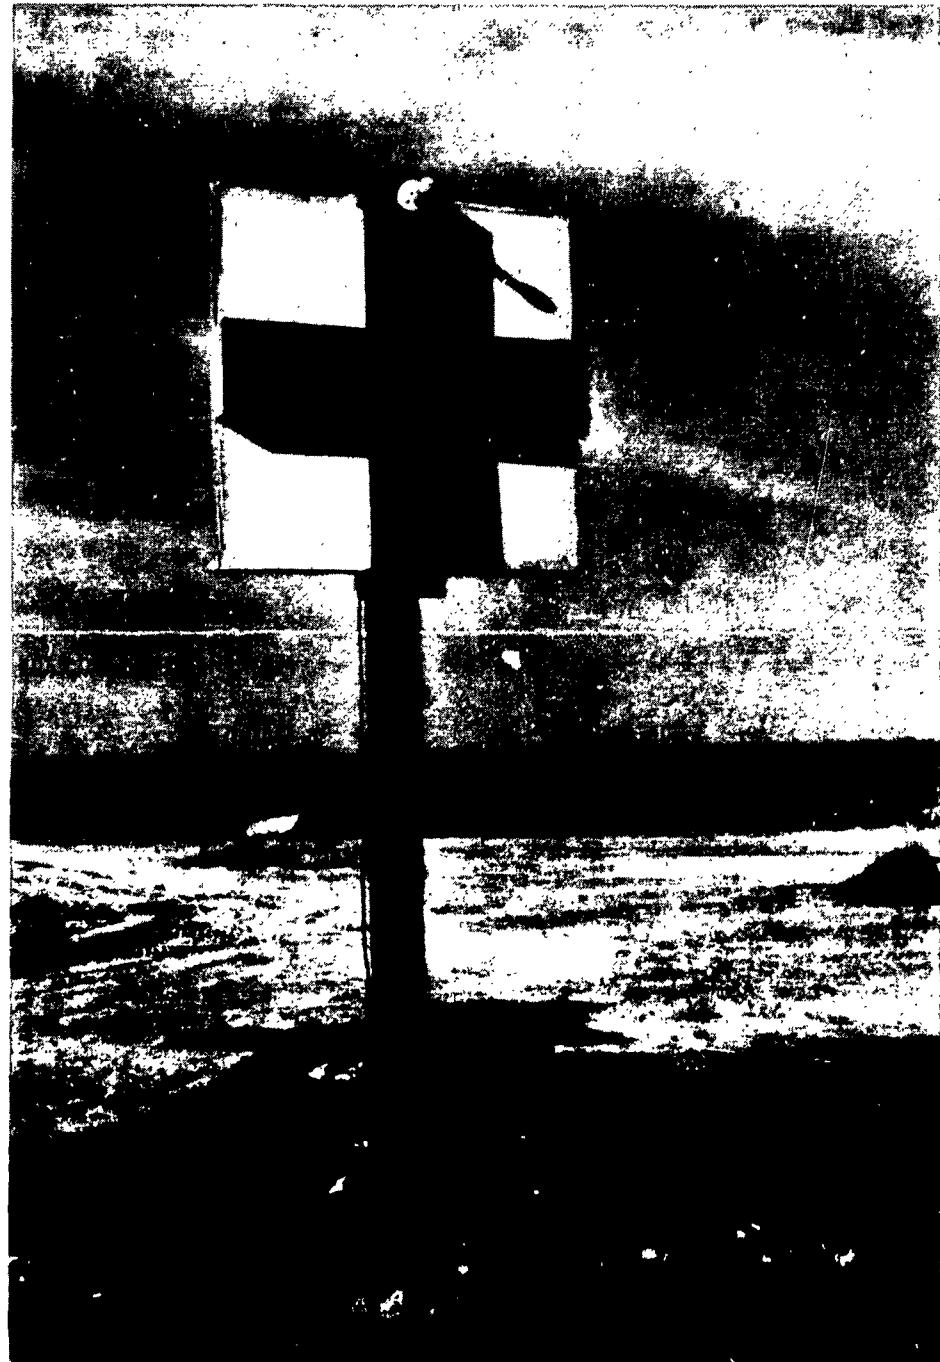

Fig. 3. Long-range target.

target face to facilitate photographic acquisition and later surface motion measurements.

Long-Range Operation. During the live run the long-range station was unmanned and operation was controlled remotely by signals transmitted from the EG&G Control Point and received on the transportainer receiver (Radio Tone Receiver, Type N-3620D1).

On receipt of the 5-min signal from the CP, a burnwire holding a canvas curtain down across the front of the transportainer was triggered and the marker filaments in the film marker units (Marker Unit, Type TD-1) were turned on. Receipt of the -5 sec signal turned on plate voltage in the film marker units and activated the photo control units, the cam timers, and all cameras. A zero fiducial signal was used to trigger the flashbulbs on the two long-range targets. This flash provided a zero reference for the marker units in all cameras.

Close-In Camera Station. The close-in camera stations (Fig. 4) consisted of shock-mounted camera platforms mounted 48 in. above ground in pipe-like structures which were firmly anchored in the ground. Three close-in stations were installed on a bearing $N45^{\circ}00'E$ at distances of 32.32, 137.20, and 274.39 meters (Fig. 5). Each close-in station was located 7.14 meters away from its respective target and each was protected by a canvas tent fitted over the tubular structure. Stabilizing rods were attached to each camera platform to prevent yawing, and a pneumatic mechanism was included to damp any damaging camera platform oscillations that might occur after the arrival of the shock wave.

The camera instrumentation for each of the three stations and pertinent operating details are given in the following table. Complete documentation of the camera operating details for each of these stations will be found in Appendix A of this report.

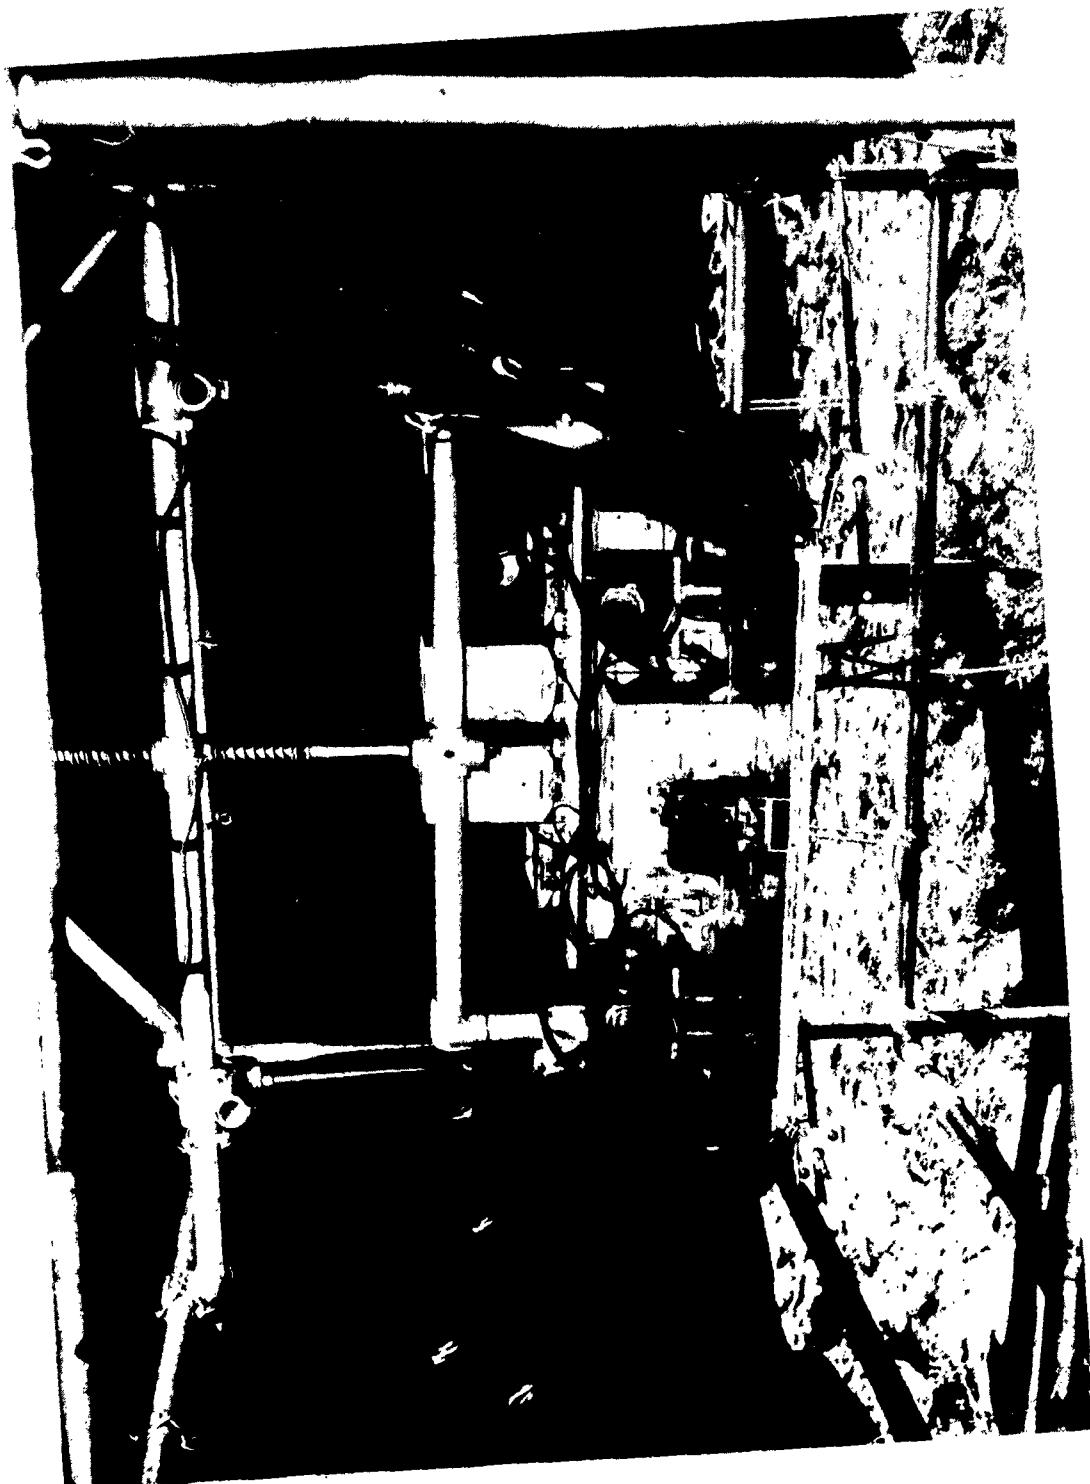

Fig. 4. Close-in camera station.

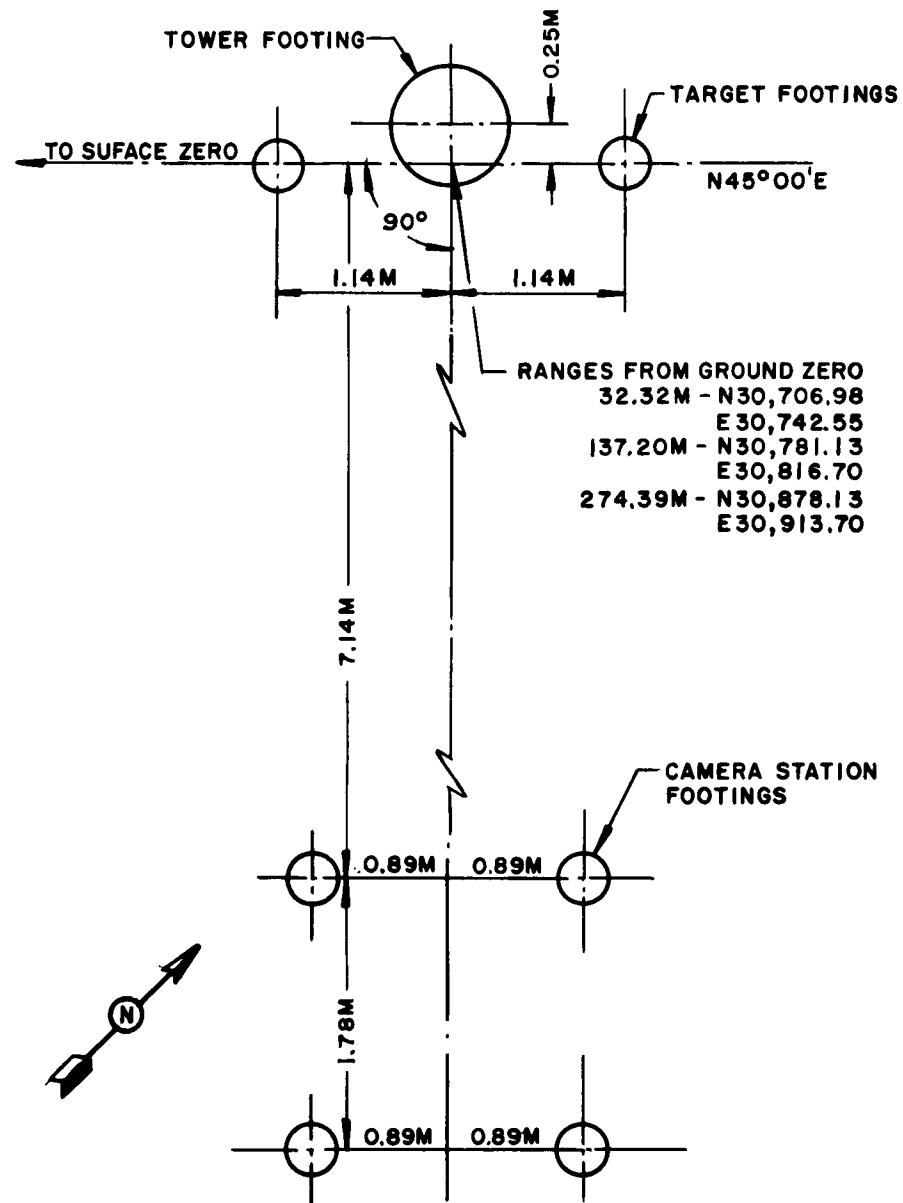

Fig. 5. Close-in target orientation.

TABLE 2 CLOSE-IN CAMERA DETAILS

Camera Type	Nominal Focal Length Lens (mm)	Nominal Frame Speed (frames/sec)	Timing Marks (cps)	Operating Time
16-mm Fairchild	13	500	200	-2 sec to +6 sec
16-mm Fairchild	50	500	200	-2 sec to +6 sec
16-mm GSAP	9.5	64	None	-2 sec to +30 sec

In addition to the camera complement, each station contained control equipment (EG&G Cam Timer, Type TD-52) and marker units (EG&G Marker Generator, Type SG-15). Control of each camera station was accomplished by the cam timers which were connected to the CP by hardwire.

Inertia-Weight Targets - The inertia-weight targets (Fig. 6) consisted of three separate parts: an 8-ft x 12-ft target face, a 70-ft crank-up telescoping tower, and a helical spring and inertia weight. The target faces and the telescoping towers were all firmly positioned in the ground facing the individual close-in camera stations. The target face footings were anchored at a distance of 7.14 meters from the footings of the respective camera station and each tower was tied firmly to the ground with 12 guy wires (4 sets of 3 each) anchored to the ground in a triangular pattern. The location of the inertia weight targets is given in Fig. 2.

The target faces (Fig. 7) which were made of three 8-ft x 4-ft sections of 1/2-in. plywood, were bolted to 2-in. diameter pipe which was sunk into the ground to a depth that would assure maximum stability. All target faces were painted black and vertical and horizontal target markings were made on each with wide strips of white Scotch-Lite tape. Vertical target markings were made across the center of each target face and at a distance of 2 ft on either side of the center line. Horizontal

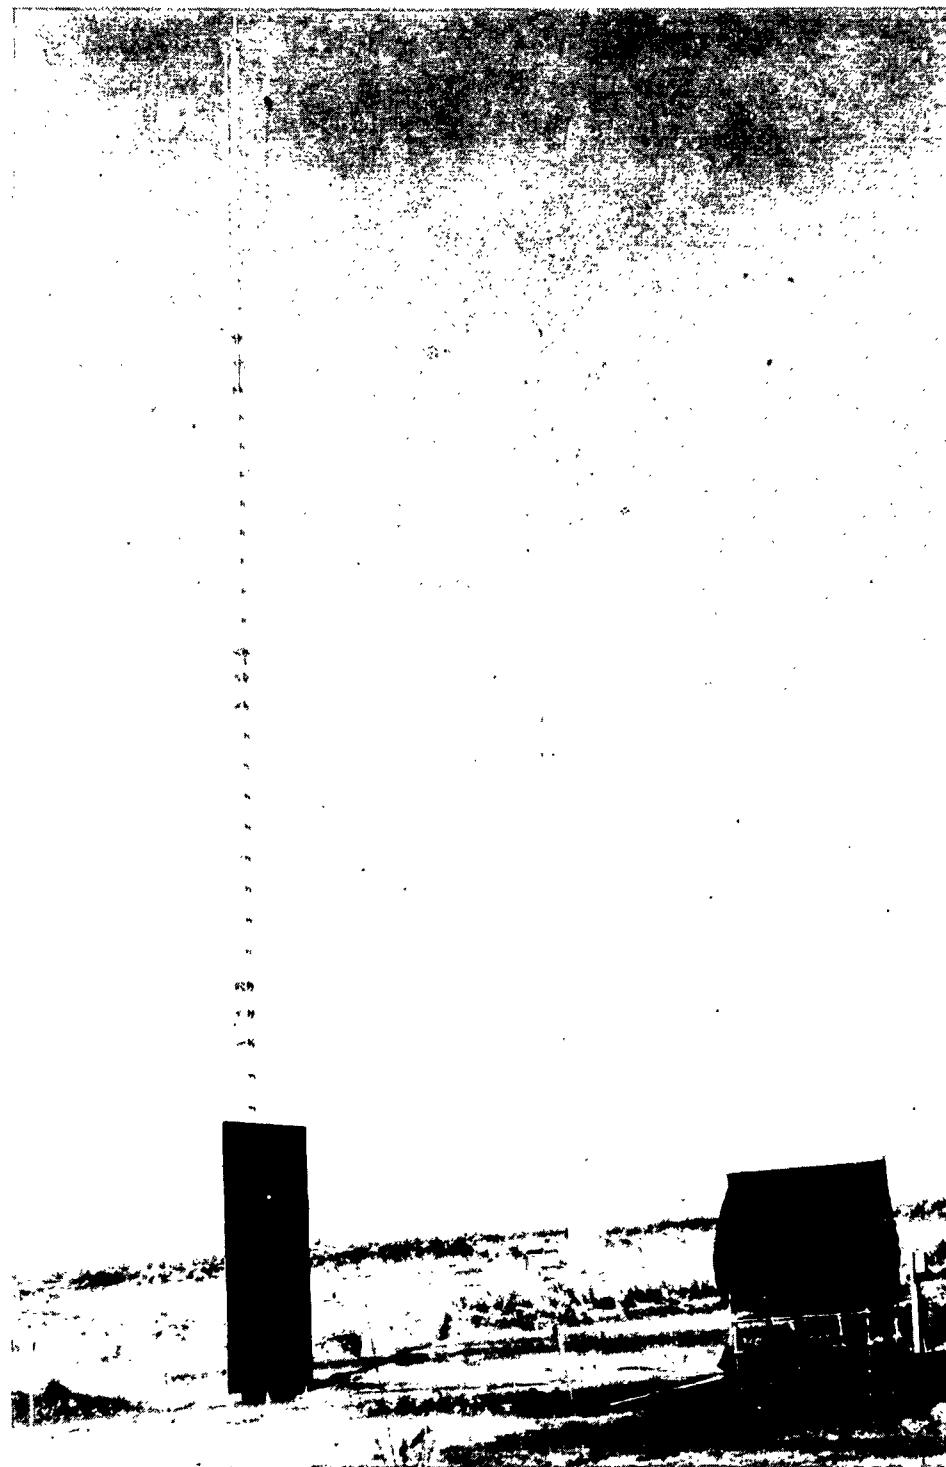

Fig. 6. Inertia-weight target.

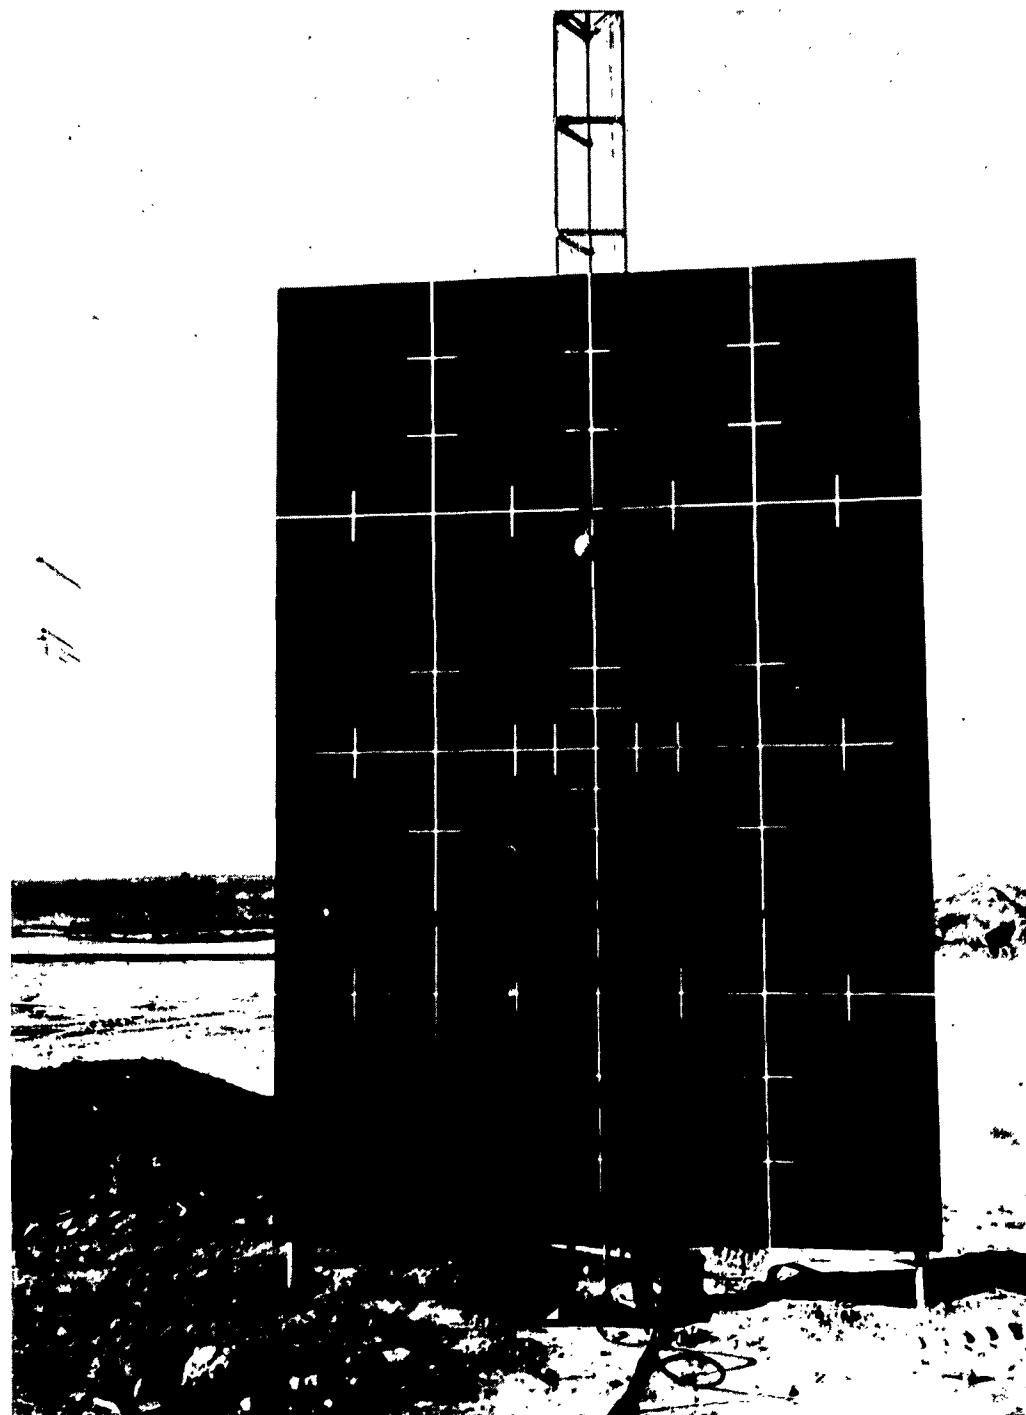

Fig. 7. Inertia-weight target face.

target markings were applied across the center of each target and at a distance of 3 ft on either side of the center horizontal stripe. Short cross-markings were applied to each vertical stripe at 1-ft intervals between the top and bottom horizontal stripes and 1-ft on either side of the center horizontal stripe. The horizontal stripes were cross-marked at 1-ft intervals between each vertical stripe, and an additional cross-mark was applied 6-in. on either side of the center horizontal and vertical stripes. A single flash bulb, mounted above the center of each target, when flashed would be used as a zero-time reference in the final films.

The helical spring and inertia weight for each target assembly were suspended from the telescoping towers (see Fig. 6). The spring and weight combination at each target was selected to insure that the reference would remain stationary through the time of interest (approximately 1.6 sec). All spring and weight combinations were held in their natural free positions until -1 sec by a burnwire to insure that they would be essentially motionless at zero time.

Close-In Operation. The close-in stations were unmanned during the live runs and operation was controlled by hardwire signals from the Control Point. The -5 sec signal from the CP activated the cam timers at each station and the cam timers programmed camera turn-on, marker generator operation, burnwire release (-1 sec). A separate signal controlled flash bulb ignition (Z time).

RESULTS

System Operation. Of the fifteen cameras employed (see Tables 1 and 2) on this event, fourteen operated through the time of interest and yielded records. (For some as yet inexplicable reason,

one 16-mm Fairchild camera at the 274.39 m close-in station failed to operate.) The film records from all cameras have been processed and the requisite number of prints have been forwarded to DASA and to the AEC to fulfill their requirements. All of the original earth-motion films have been forwarded to EG&G, Boston, and seven of the films have been read.

Initial reports of camera station operation show that the timing markers in the long-distance stations functioned properly but that the close-in station timing markers did not. The 274.39 m close-in station timing markers were "out" at D-45 min but personnel were not allowed to remain in the area to effect repair. Full details of camera station operation will be included in the final report.

Based on a preliminary scan and evaluation, six of the films from the 9 close-in inertia weight station cameras (all 3 films from the 32.32 m station, the GSAP record from the 137.20 m station, and the 2 films from the 274.39 m station) and one film from the long-range station were chosen for preliminary analysis. All eight films from the close-in stations recorded zero time as evidenced by recording of the zero-reference flash on each target. However, the inertia weight on the 137.20 m target left the field of view of two of the cameras before shock arrival at the target so the films from these two were not read.

Analysis. For the 137.20 m and 274.39 m station films, measurements of the position of the inertia weights with respect to their target markings were taken at times from approximately zero minus 400 msec to zero plus 1.9 sec and plots were made of displacement versus time based on the nominal film speed of the governor-controlled GSAP in both close-in stations. (The nominal film speed was used since the timing markers did not operate.) The plots of displacement versus time for the 32.32 m station cameras were made based on a corrected film speed as determined by the one long-range film read. Since timing marks and the zero-reference flash from the long-range target

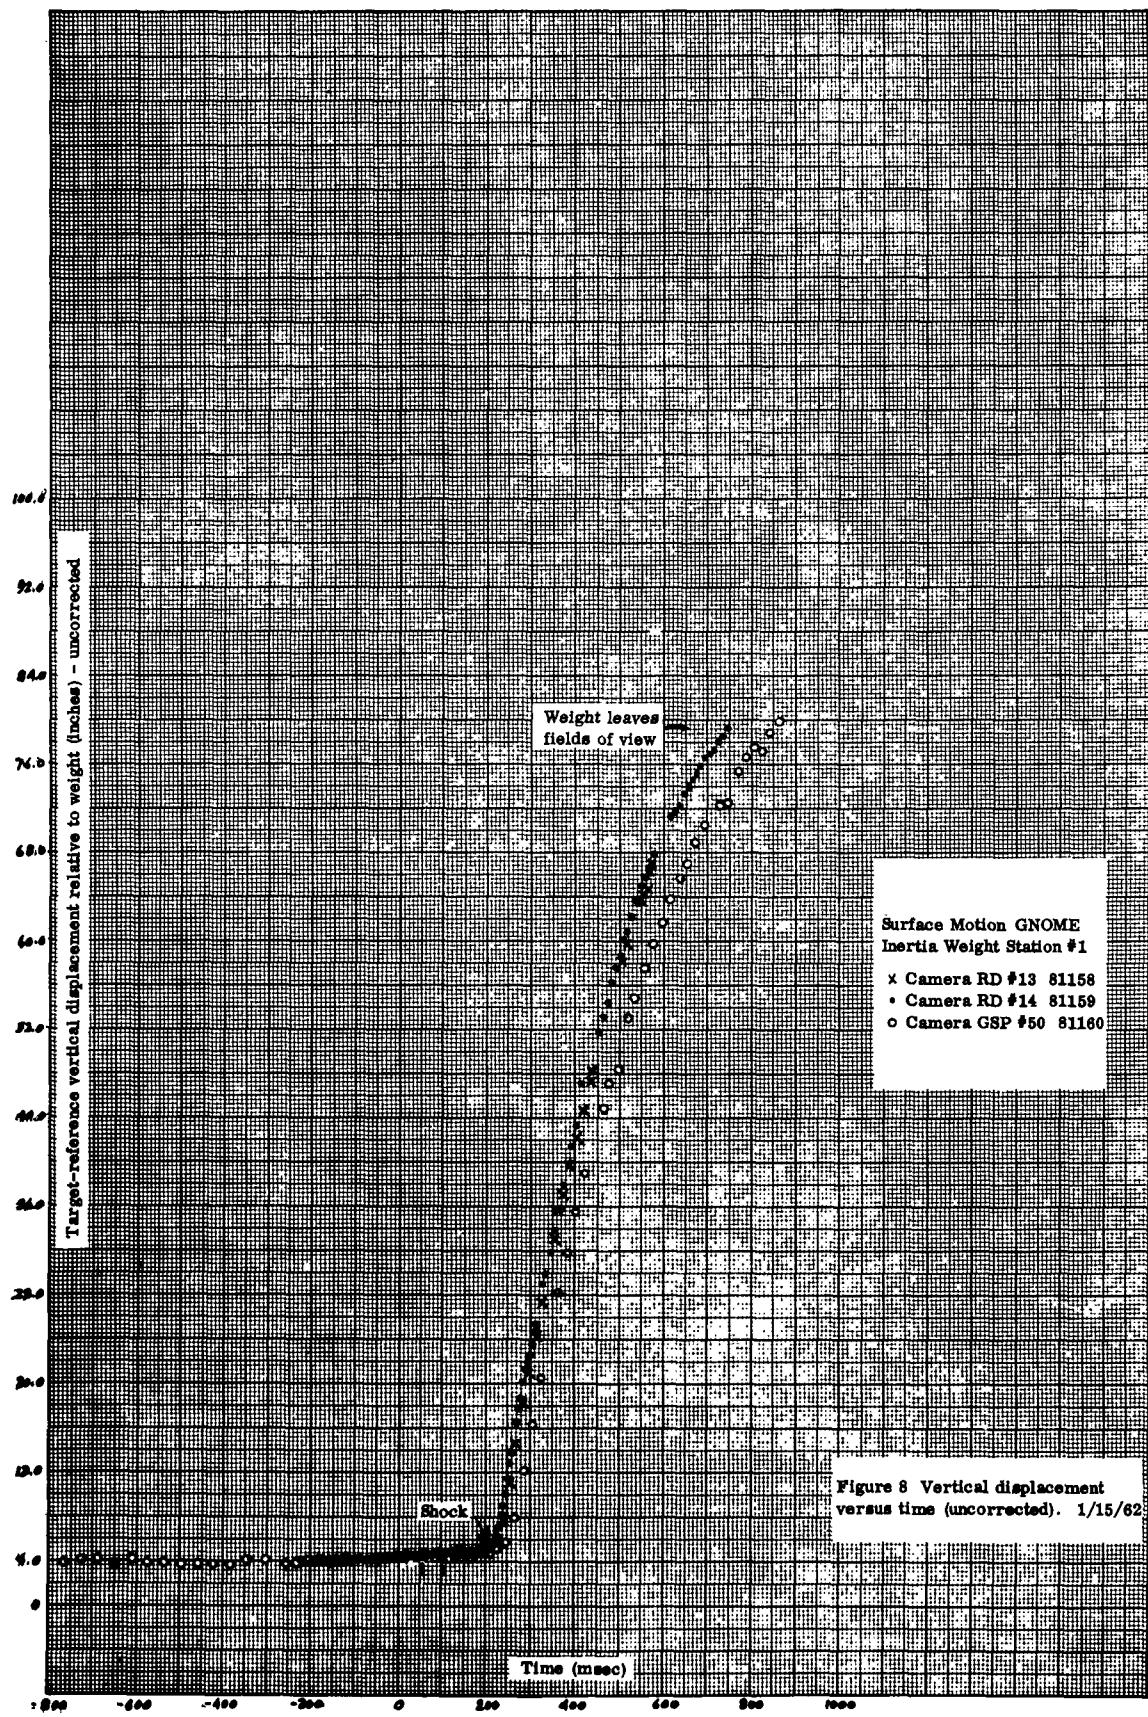

at 30.49 m and the inertia weight target at 32.32 m were both recorded on the long-range film, the 32.32 m close-in records were plotted on the more accurate time base. The plots of displacement versus time for the inertia weight targets are given in Figs. 8 through 10. The "corrected" (any wind displacements subtracted out) plots of displacement are given in Figs. 11 through 14.

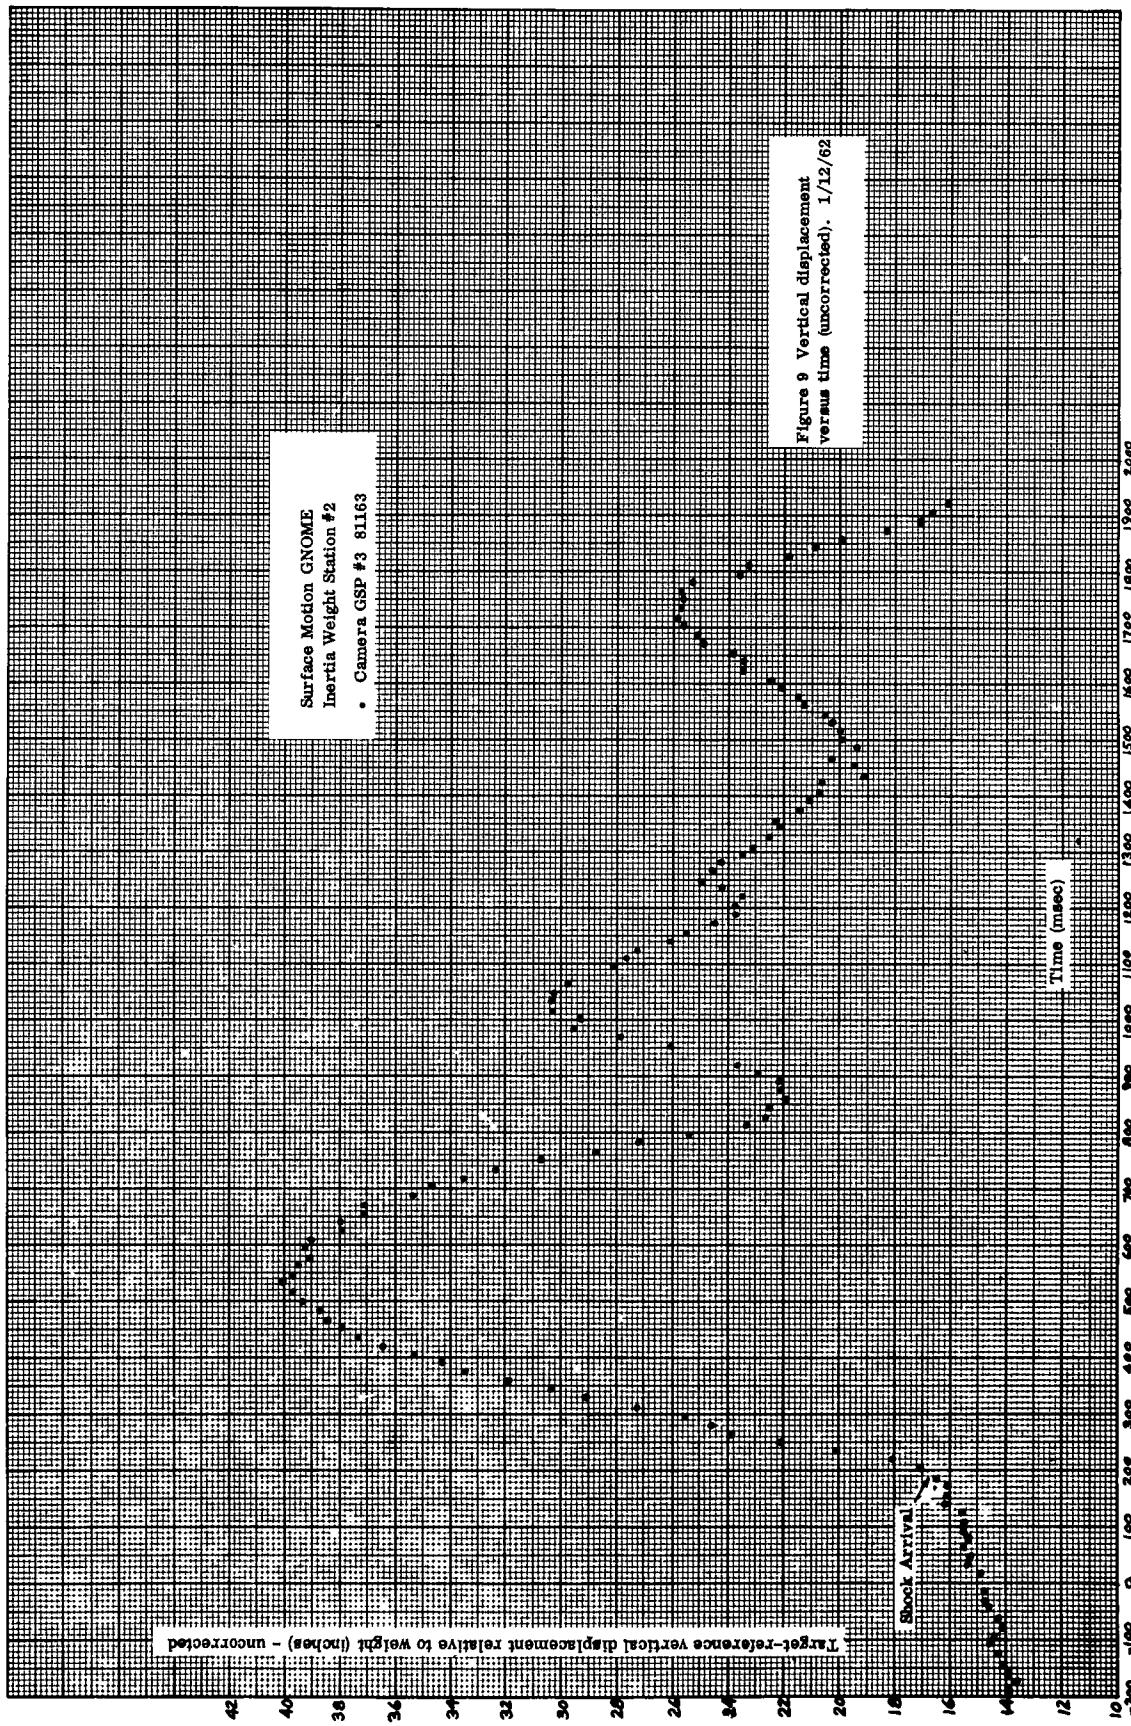

Since the inertia weight at the 32.32 m target left the field of view of all three cameras before maximum displacement was recorded, the record from the 305 mm lens equipped Mitchell in the long range station was read to see if it would yield the maximum displacement. Although the 32.32 m close-in target motion was recorded, the record became erratic due to shock wave arrival at the transportainer and post shock wave data is suspect. The displacement versus time for the long range camera is given in Fig. 14.

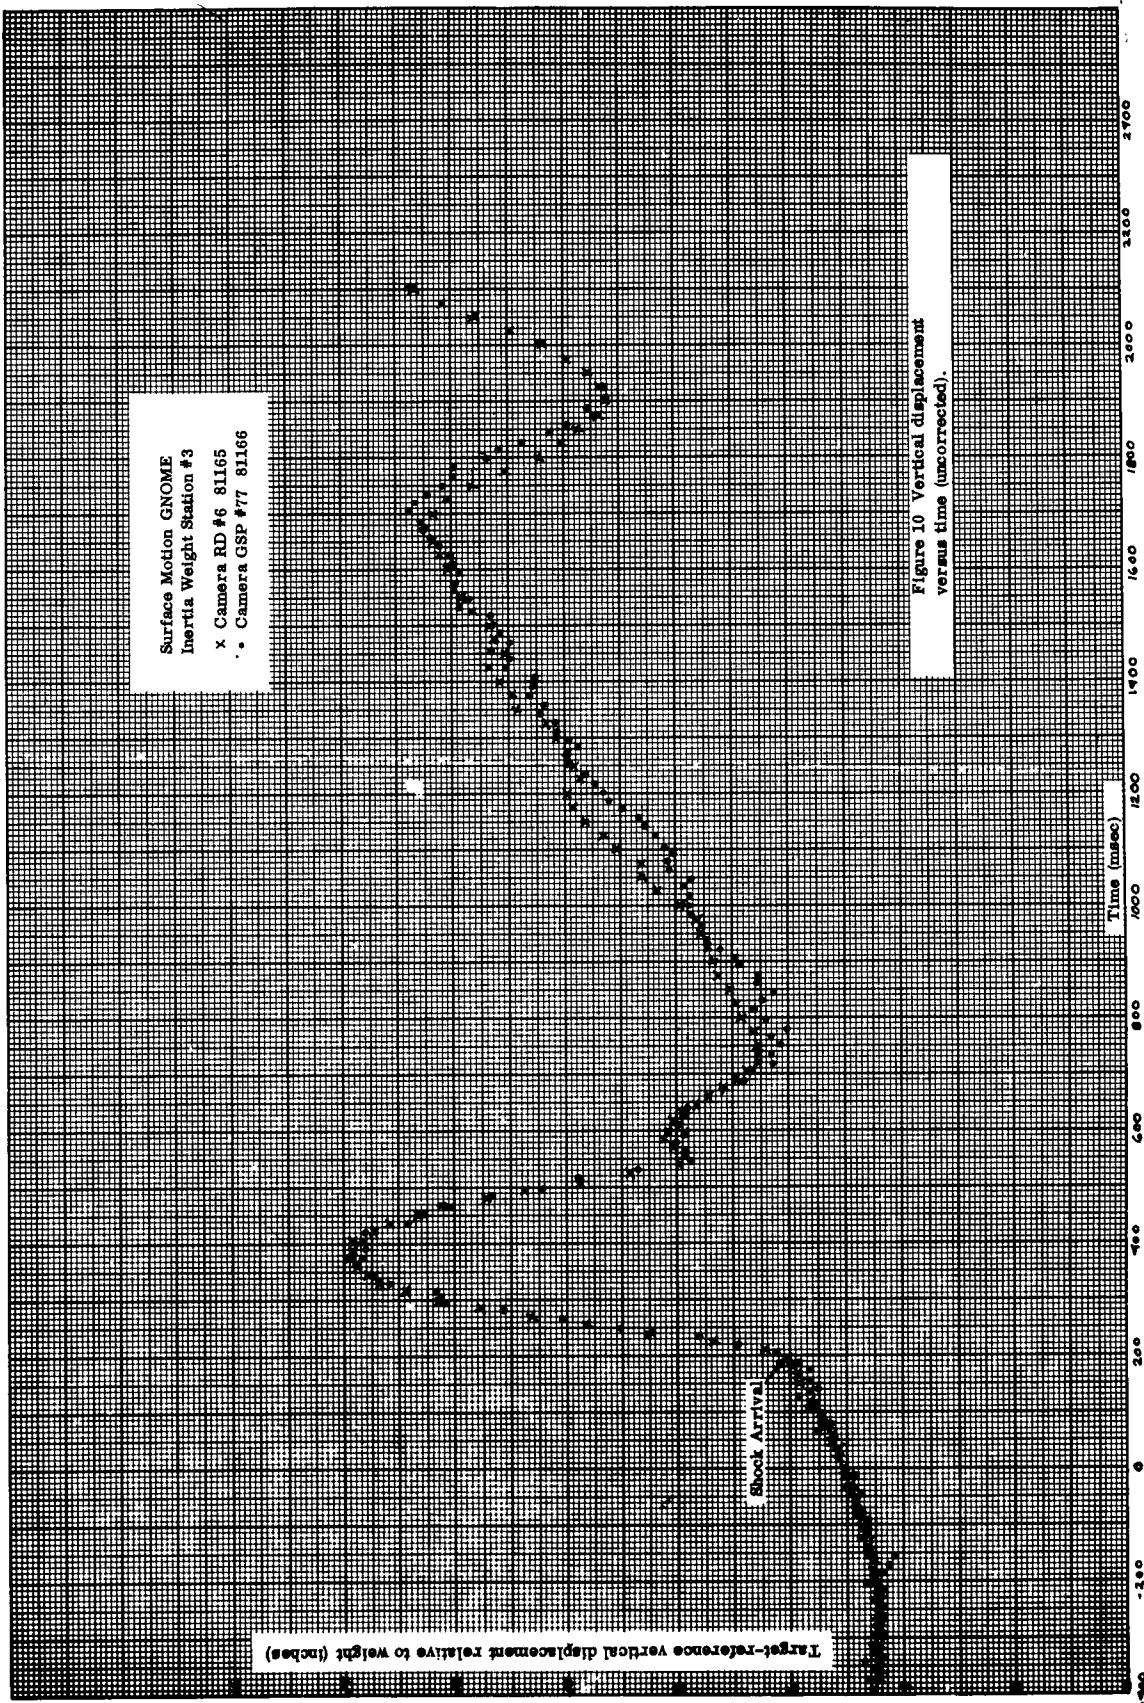

TABLE 3. ANALYSIS RESULTS

Camera Station	Target Distance (from Surface Zero)	Shock Arrival	Max. Displacement	Time of Max. Displacement
32.32mIW	32.32 m	211 msec ^a	72.7 in. +	864 msec +
137.20mIW	137.20 m	200 msec	19.65 in.	530 msec
274.31mIW	274.31 m	200 msec	7.58 in.	375 msec
1, 274.86mLR	15.24 m	211 msec	69.6 in.	770 msec
	30.49 m	211 msec	68.4 in.	770 msec

^aThis shock arrival time would appear to be out of order relative to the other arrival times. This is due to the different methods of calculating the camera speeds previously mentioned.

versus time (uncorrected). 1/12/62

CONCLUSIONS AND RECOMMENDATIONS

Preliminary analysis of the film records from the inertia-weight stations and from the long-range camera station substantiates the validity of the inertia-weight surface motion photography method, particularly in regard to high-resolution measurements. In addition, the correlation of data from the long-range and close-in stations proves the efficacy of the dual technique approach. Although the inertia-weight method appears to be superior to the long-range system in determining surface motion, it would appear prudent to retain both methods until such time as sufficient data exists to predict the amplitude and duration of surface motion that would result from any scheduled event. Furthermore, the back-up provided by the dual-method technique of surface-motion photography would insure that records would be obtained in any given case and provide correlation data.

- COLUMN 1: Time (in msec.) with reference to zero time
- COLUMN 2: Frame number of the film read
- COLUMN 3: Position of the reference (in film inches)
- COLUMN 4: Position of the weight (in film inches)
- COLUMN 5: Target-reference vertical displacement relative to weight, ie. column 3 minus column 4 (in film inches)
- COLUMN 6: Measured film distance (in film inches) from the reference used to another target marker of known actual distance
- COLUMN 7: Target-reference vertical displacement relative to weight (in actual inches) calculated by direct proportion.
- COLUMN 8: When necessary, this column is used to refer all displacements to one particular target reference (actual inches).

DISPOSITION OF FILM RECORDS

The original copies of all surface motion records from the Gnome event will be retained by EG&G until final analysis work has been completed. To date, disposition of prints from these originals has been as follows.

Reel No.	Perf. Nos. <small>(Included in reel)</small>	No. of Prints <small>(Entire Reel)</small>	Agency & No. Rec.
PL-1	81,158	9	EG&G (2)
	81,159		DASA (3)
	81,160		LASL (2)
	81,161		LRL (2)
	81,162		
	81,163		
	81,165		
PL-2	81,152	9	EG&G (2)
	81,153		DASA (3)
	81,154		LASL (2)
	81,155		LRL (2)

* Camera identification number for the perforation numbers are given in the photo loading charts in Appendix A.

DISTRIBUTION LIST

One copy will be distributed to each agency, unless otherwise indicated.

Assistant to the Secretary of Defense for Atomic Energy, Department of Defense, Washington 25, D.C.
Chief, Advanced Research Projects Agency, Washington 25, D.C.
Chief, Air Force Technical Applications Center, Washington 25, D.C.
Chief, Defense Atomic Support Agency, P.O. Box 2610, Washington 25, D.C. ATTN: Document Library Branch
Commander, Field Command, Defense Atomic Support Agency, Sandia Base, Albuquerque, New Mexico ATTN: FCWT; FCTG5 (2 copies)
Officer in Charge, Field Command, Defense Atomic Support Agency, Lawrence Radiation Laboratory, Livermore, California
Commander, Armed Services Technical Information Agency (ASTIA), Arlington Hall Station, Arlington 12, Virginia (5 copies)
Sandia Corporation, Sandia Base, Albuquerque, New Mexico ATTN: Section 7250, A.D. Thornbrough (1 copy); W.R. Weart (1 copy); Library (4 copies)
Sandia Corporation, Livermore Branch, P.O. Box 969, Livermore, California ATTN: Technical Library
Space Technology Laboratories, Inc., Ramo-Wooldridge Corporation, P.O. Box 95001, Los Angeles 45, California ATTN: Dr. D.B. Langmuir; James F. Halsey (2 copies)
U.S. Atomic Energy Commission, Technical Library, Washington 25, D.C. (3 copies)
U.S. Atomic Energy Commission, Albuquerque Operations Office, P.O. Box 5400, Albuquerque, New Mexico ATTN: K.F. Hertford; J.E. Reeves (2 copies)
Office of Field Operation, U.S. Atomic Energy Commission, Las Vegas, Nevada (20 copies)
Los Alamos Scientific Laboratory, P.O. Box 1663, Los Alamos, New Mexico ATTN: G.A. Cowan; Report Librarian (2 copies)
Lawrence Radiation Laboratory, University of California, P.O. Box 808, Livermore, California ATTN: Technical Information Division (25 copies); L-6 (1 copy); Clovis G. Craig (4 copies)
Laboratory of Nuclear Medicine and Radiation Biology, School of Medicine, University of California, Los Angeles, 900 Veteran Avenue, Los Angeles 24, California
University of California, Environmental Radiation Division, Laboratory of Nuclear Medicine, 10875 LeConte Avenue, Los Angeles 24, California ATTN: K.H. Larson (2 copies)
University of California, Lawrence Radiation Laboratory, Technical Information Division, Berkeley 4, California ATTN: Dr. R.K. Walkerling (2 copies)
University of California, Chemistry Department, Berkeley, California ATTN: Dr. Willard F. Libby
Edgerton, Germeshausen & Grier, Inc., 160 Brookline Avenue, Boston 15, Massachusetts ATTN: F.I. Strabala (2 copies)
Edgerton, Germeshausen & Grier, Inc., 300 Wall Street, P.O. Box 1912, Las Vegas, Nevada ATTN: R.A. Lusk
Mr. Carroll L. Tyler, Project Manager, Reynolds Electrical & Engineering Co., Inc., P.O. Box 352, Las Vegas, Nevada
Holmes & Narver, Inc., 849 South Broadway, Los Angeles 14, California
SAN Operations Office, U.S. Atomic Energy Commission, 2111 Bancroft Way, Berkeley 4, California ATTN: E.C. Shute (1 copy); Technical Services Division (5 copies)

Stanford Research Institute, P. O. Box 725, Menlo Park, California ATTN: R. B. Hoy; L. M. Swift (2 copies)

Director, Waterways Experiment Station, P. O. Box 631, Vicksburg, Mississippi ATTN: Library

U.S. Army Engineer Waterways Experiment Station, Corps of Engineers, Jackson Installation, Concrete Division, P.O. Drawer 2131, Jackson, Mississippi ATTN: J. M. Polatty (3 copies)

Oak Ridge Institute of Nuclear Studies, P. O. Box 117, Oak Ridge, Tennessee ATTN: The Library

Oak Ridge National Laboratory, Union Carbide Nuclear Company, P. O. Box X, Oak Ridge, Tennessee ATTN: J. W. Landry (1 copy); X-10 Laboratory Records Department (4 copies)

Shell Development Company, 3737 Bellaire Blvd, Houston, Texas ATTN: Dr. Aaron J. Sheriff

U. S. Coast & Geodetic Survey, Department of Commerce, Washington 25, D.C. ATTN: Chief, Division of Geophysics

U. S. Coast & Geodetic Survey, Department of Commerce, P.O. Box 267, Mercury, Nevada ATTN: Thomas H. Pearce

U. S. Coast & Geodetic Survey, Washington 25, D.C. ATTN: L. M. Murphy; W. V. Mickey; Dr. Dean S. Carder (3 copies)

U. S. Coast & Geodetic Survey, New Mint Building, San Francisco, California ATTN: W. K. Cloud

U. S. Geological Survey, Federal Center, Denver 25, Colorado ATTN: Dr. George Keller (1 copy); Karl Roach (1 copy); Librarian (3 copies)

U. S. Geological Survey, P. O. Box 4217, Albuquerque, New Mexico ATTN: C. V. Theis

U. S. Geological Survey, 4 Homewood Place, Menlo Park, California ATTN: Librarian (2 copies)

Dr. T. B. Nolan, Director, U. S. Geological Survey, Washington 25, D.C.

U. S. Geological Survey, Room 1033, General Services Administration Building, Washington 25, D.C. ATTN: Librarian

U. S. Geological Survey, Room 2235, General Services Administration Building, Washington 25, D.C. ATTN: Chief, Radiohydrology Section, WR Division

Space-General Corporation, 777 Flower Street, Glendale 1, California ATTN: Glenn C. Brown

Commanding General, U. S. Army Engineer Research & Development Laboratories, Fort Belvoir, Virginia ATTN: Technical Documents Center; S. E. Dwornik, Director, Mine Detection Branch (2 copies)

Texas Instruments, Inc., Geosciences Division, P. O. Box 35084, Airlawn Station, Dallas 35, Texas ATTN: Hubert M. Rackets

The Geotechnical Corporation, P. O. Box 28277, Dallas 28, Texas ATTN: Ernest Stevens

Allied Research Associates, Inc., 43 Leon Street, Boston 15, Massachusetts ATTN: Dr. Arnold H. Glaser

Commanding General, Aberdeen Proving Ground, Maryland ATTN: Technical Library, Building 313 (9 copies)

Air Force Cambridge Research Laboratories, Laurence G. Hanscom Field, Bedford, Massachusetts ATTN: CROTLR

Commandant, Air Force Institute of Technology, Wright-Patterson Air Force Base, Ohio ATTN: Library, MCLI-ITLIB

Argonne National Laboratory, 9700 South Cass Avenue, Argonne, Illinois ATTN: Dr. Hoylande D. Young

U. S. Army Engineer Division, South Pacific, 630 Sansome Street, P. O. Box 3339 Rincon Annex, San Francisco, California ATTN: Chief, Engineering Division

U. S. Atomic Energy Commission, Washington 25, D.C. ATTN: Dr. Spofford G. English, Special Assistant to the General Manager
